

Summary

- Using Windows Applications in Process Plants
 - » The windows packages that run in conjunction with the control software in the PD5015, enable the system's designers to present a professional and simple solution to what is a complex problem.
 - » As detailed information (recipe, premix, tanker load) is transferred to the PD5015 Controller electronically, using windows as a front end, margin for error is greatly reduced.
 - » The training of operators to use windows applications is NOT complex, and therefore no particular computer skills are required to run the FSL Bells Production System.
